---

---

---

---

---

---

## Stages of Treatment Testing

- Phase I
  - The safe dose range, side effects, early activity.
- Phase II
  - Sufficient promise for further testing, more side effect assessment, refinement of dose, evidence of disease subtypes with most promise and feasibility.
  - Some design examples: single arm 2-stage, single arm pilot, multi-arm randomized (screening or selection).
- Phase III
  - Formal comparison of new treatment to “standard”.

---

---

---

---

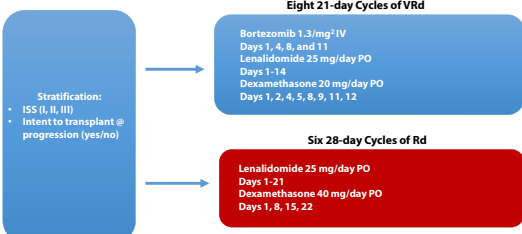

---

---

---

---

## EXAMPLE: SWOG S0777 Study Design

**Stratification:**

- ISS (I, II, III)
- Intent to transplant @ progression (yes/no)

**Eight 21-day Cycles of VRd**

- Bortezomib 1.3/mg<sup>2</sup> IV Days 1, 4, 8, and 11
- Lenalidomide 25 mg/day PO Days 1-14
- Dexamethasone 20 mg/day PO Days 1, 2, 4, 5, 8, 9, 11, 12

**Six 28-day Cycles of Rd**

- Lenalidomide 25 mg/day PO Days 1-21
- Dexamethasone 40 mg/day PO Days 1, 8, 15, 22

---

---

---

---

---

---

---

---

## STRONG RESULT BECAUSE OF BEST SCIENCE AND DATA

**Bortezomib with lenalidomide and dexamethasone versus lenalidomide and dexamethasone alone in patients with newly diagnosed myeloma without intent for immediate autologous stem-cell transplant (SWOG S0777): a randomised, open-label, phase 3 trial**

Blau G, Duric A, Guhlmann M, et al. *Lancet Oncol*. 2019;20(11):1419-1429. doi:10.1016/S1473-3099(19)30287-0

**Summary**  
Background: Lenalidomide plus dexamethasone is a reference treatment for patients with newly diagnosed myeloma. The combination of the proteasome inhibitor bortezomib with lenalidomide and dexamethasone has shown significant efficacy in the setting of newly diagnosed myeloma. We aimed to study whether the addition of bortezomib to lenalidomide and dexamethasone would improve progression-free survival and provide better response rates in patients with previously untreated multiple myeloma who were not planned for immediate autologous stem-cell transplant.

**Methods:** In this randomised, open-label, phase 3 trial, we recruited patients with newly diagnosed multiple myeloma aged 18 years and older from participating treatment Oncology Group (SWOG) and National Clinical Trial Network.

## And regulatory impact

**NEW RELEASE**

**Celgene Receives CHMP Positive Opinions for Both REVLMID® (lenalidomide) and IMNROID® (pomalidomide)-Based Triplet Combination Regimens for Patients with Multiple Myeloma**

3/29/2019

The CHMP adopted two positive opinions recommending European Commission approval of:

- REVLMID in combination with bortezomib and dexamethasone (RVB) in adult patients with previously untreated multiple myeloma who are not eligible for autologous stem cell transplant.
- IMNROID in combination with bortezomib and dexamethasone (IMB) in adult patients with previously untreated multiple myeloma, without an intent for immediate autologous stem cell transplant (ASCT).<sup>1</sup>

SUMMARY: (N) - (BUSINESS WIRE) - Celgene Corporation (NASDAQ:CELG) announced today that the European Medicines Agency's (EMA) Committee for Medicinal Products (CHMP) has adopted two positive opinions for two triplet regimens based on Celgene's proprietary immunomodulators, lenalidomide (REVLMID) and pomalidomide (IMNROID). The CHMP positive opinion for REVLMID was based on the data from SWOG S0777 (NCT00709056) evaluating the triplet combination of REVLMID, bortezomib and dexamethasone (RVB) in adult patients with previously untreated multiple myeloma, without an intent for immediate autologous stem cell transplant (ASCT).<sup>1</sup> Results from SWOG S0777 showed statistically significant progression-free (PFS) and overall survival (OS) improvements in patients treated with RVB compared to those treated with lenalidomide and dexamethasone alone (LD). The choice of treatment in a first-line therapy setting is important as patients progressively become less responsive to therapy and experience shorter periods of remission at later lines of treatment.<sup>2</sup>

---

## Critical Elements in Evaluating Therapeutic Interventions

- Biological Activity
- Safety/Toxicity
- Clinical Efficacy
  - Response, Survival
  - Patient Reported Outcomes

---

---

---

---

---

---

---

---

### Variability and Bias

- What are they and how do they arise?
- What problems do they cause?
- How can they be prevented or reduced?

SWOG NCI

---

---

---

---

---

---

---

---

### Bias and Variation

Accurate & Precise    Accurate & Imprecise    Inaccurate & Precise    Inaccurate & Imprecise

SWOG NCI

---

---

---

---

---

---

---

---

### How do we control variability?

- Eligibility criteria

*Example:* Results of studies which allow only patients with local disease and performance status 0-1 will be less variable than those from studies allowing any stage and any performance status.

SWOG NCI

---

---

---

---

---

---

---

---

### How do we control variability? (cont.)

- Sample size  
Larger numbers of patients lead to reduced variability.

---

---

---

---

---

---

---

### The CRA's Role in Reducing Variability

- Verification of eligibility
- Avoidance of deviations from protocol treatment plans
- Submission of timely and complete data

---

---

---

---

---

---

---

### Bias

- A tendency for a statistical result to differ on average from the true state of affairs, often due to flaws in the design or conduct of a study.

---

---

---

---

---

---

---

Bias

- Example  
If a study of a treatment intended for patients with local disease includes a number of patients with more advanced disease, the treatment's efficacy may be underestimated.

SWOG National Cancer Institute National Cancer Institute

---

---

---

---

---

---

---

---

Bias

- Solution  
Ensure adherence to eligibility criteria

SWOG National Cancer Institute National Cancer Institute

---

---

---

---

---

---

---

---

Bias

- Example  
If patients in an adjuvant therapy arm of a comparative study are followed more closely than those in an observation arm, the benefit of the adjuvant therapy may be underestimated.

SWOG National Cancer Institute National Cancer Institute

---

---

---

---

---

---

---

---

Illustration of Bias

- Results with Complete Follow-up
  - NED 3/1/16
  - Asymptomatic Bone Lesions 5/1/16
  - Tumor Recurrence 7/1/16
  - Death, Cause Unknown 9/1/16
  - Progression Date 5/1/16

---

---

---

---

---

---

---

---

Illustration of Bias

- Effect of Missing Follow-up #1
  - NED 3/1/16
  - Bone Scan Not Done 5/1/16
  - Tumor Recurrence 7/1/16
  - Death, Cause Unknown 9/1/16
  - Progression Date 7/1

---

---

---

---

---

---

---

---

Illustration of Bias

- Effect of Missing Follow-ups #1 and #2
  - NED 3/1/16
  - Bone Scan Not Done 5/1/16
  - Exam Postponed 7/1/16
  - Death, Cause Unknown 9/1/16
  - Progression Date None!

---

---

---

---

---

---

---

---

**Bias**

- Solution
  - Ensure adherence to protocol requirements for follow-up examinations
- Schedule
  - Have patients return for evaluation according to protocol schedule
- Tests
  - Have all required tests performed at each evaluation

SWOG NCI NCI

---

---

---

---

---

---

---

---

**The CRA's Role in Controlling Bias**

- Verification of eligibility
- Adherence to protocol follow-up requirements

SWOG NCI NCI

---

---

---

---

---

---

---

---

**Variability and Bias in Survival Data**

- Survival -- how long patients live after entering a study -- is often the most important outcome we study
- Incomplete data increases both variability and bias in studies of survival

SWOG NCI NCI

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### What We Need

- Complete and timely submission of accurate, legible data
- Thorough documentation of all eligibility criteria

Logos: SWOG, NCI, NCI, NCI

---

---

---

---

---

---

---

---

What We Need, cont.

- Complete description of all treatment received, whether according to protocol or not
- Complete description of objective status and toxicities at every evaluation

---

---

---

---

---

---

---

Effect of Non-dropout or Non-adherence on Sample Size

$$\text{New sample size} = \text{sample size} \div (1-r)^2$$

Non-adherence Rate	Sample Size (Example)
0%	100
10%	123
20%	156
30%	204
40%	278

High quality data are essential for good studies.

Your efforts are essential for high quality data.

---

---

---

---

---

---

---

**WHY IS IT ALWAYS CRITICAL?**  
Trial Monitoring

- Accrual monitoring (Stats, SC)
- Adverse event monitoring
  - SC, Stats, AE coordinator
  - AdEERS reporting
  - Monthly reports (AE and dose summaries)
- Interim Analyses
- Data and Safety Monitoring Committee (DSMC)

SWOG  
SOUTH WESTERN ONCOLOGY GROUP  
NCI  
NATIONAL CANCER INSTITUTE

---

---

---

---

---

---

---

---

**SWOG Data Safety Monitoring Committee**

- Evaluation of interim results (endpoints, safety)
- Approval of major design changes
- Decisions on when to stop accrual, when to report early results
- Evaluate data requests from disease committee leadership for planning purposes
- **NEED HIGH QUALITY CURRENT DATA TO MAKE CRITICAL DECISIONS**
